HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Design, construction and analysis of a thermal energy storage system adapted to greenhouse cultivation in isolated northern communities

The Greenhouse

- Located at Kuujjuaq (Quebec, 58°N latitude)
- Built in 2012
- Surface area of 140 m²
- Polycarbonate casing
- Growing season from June to September (without heating system)
- In 2016, about one ton of vegetables were harvested

The Problem...

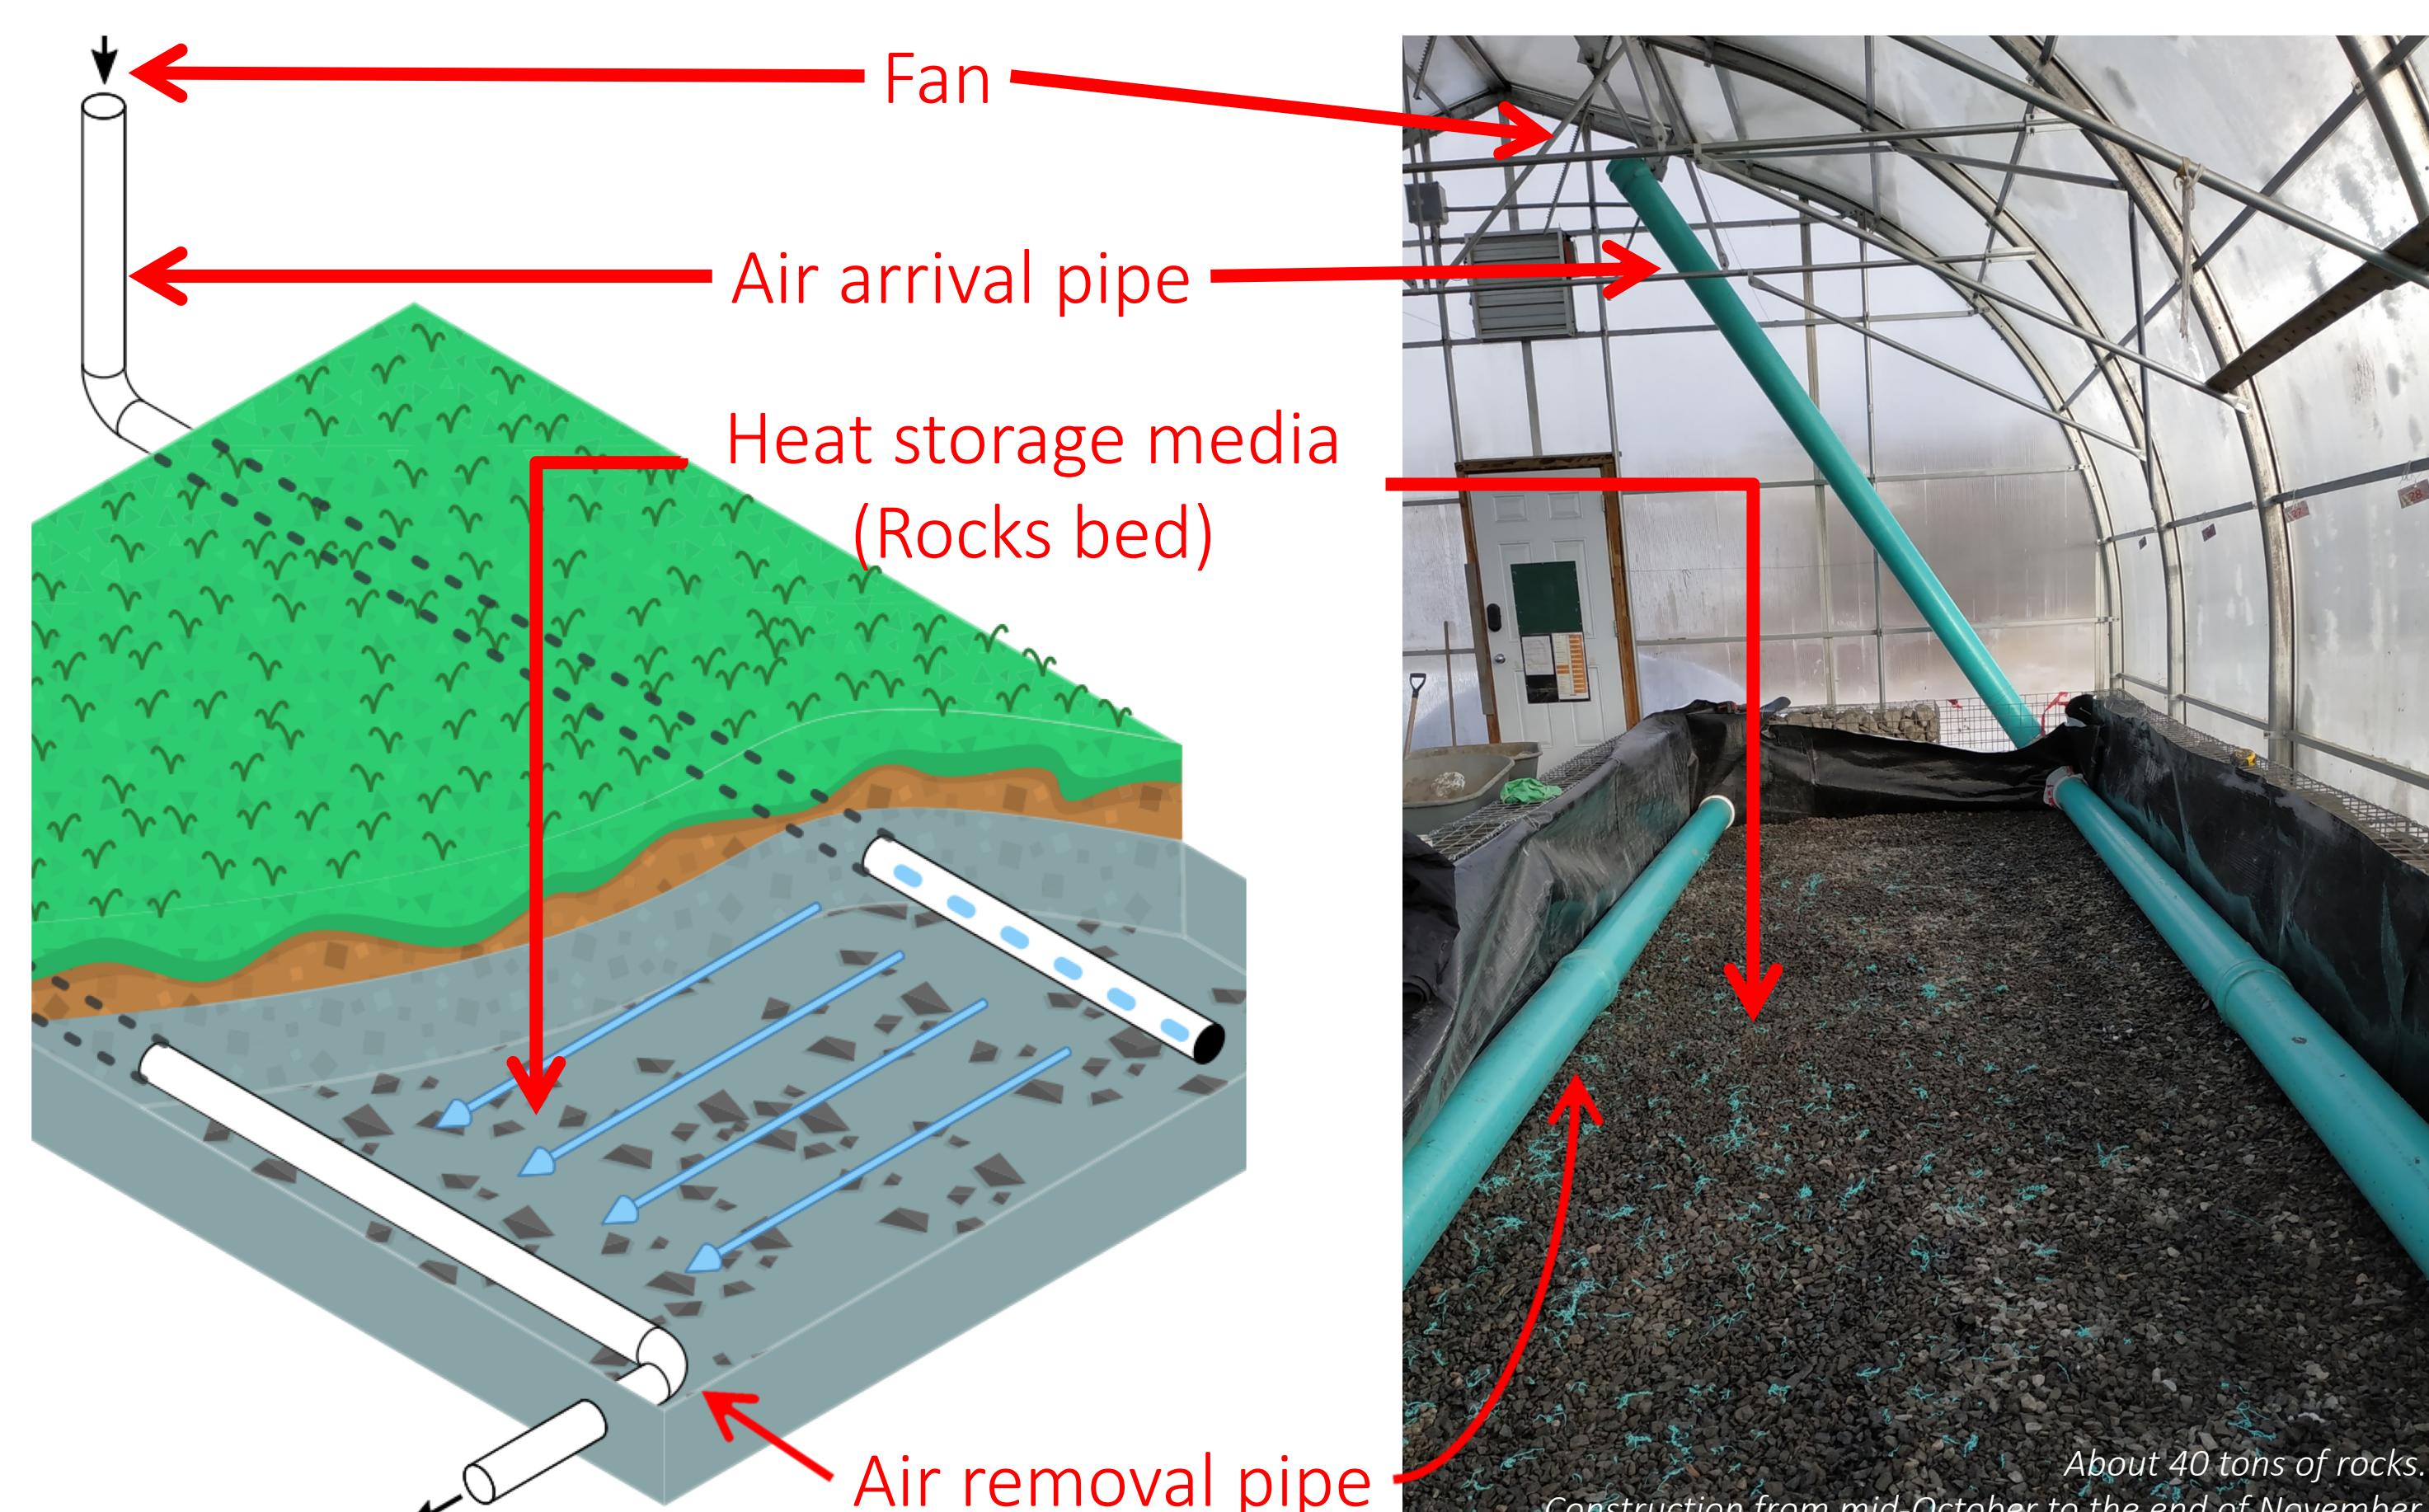

During the growing season, the day-night temperature difference is unfavorable to plant growth:

- the temperature rises too high during the day → Need to **extract heat** from the greenhouse to the outside
- and drops too low at night → It would be necessary to **provide heat**

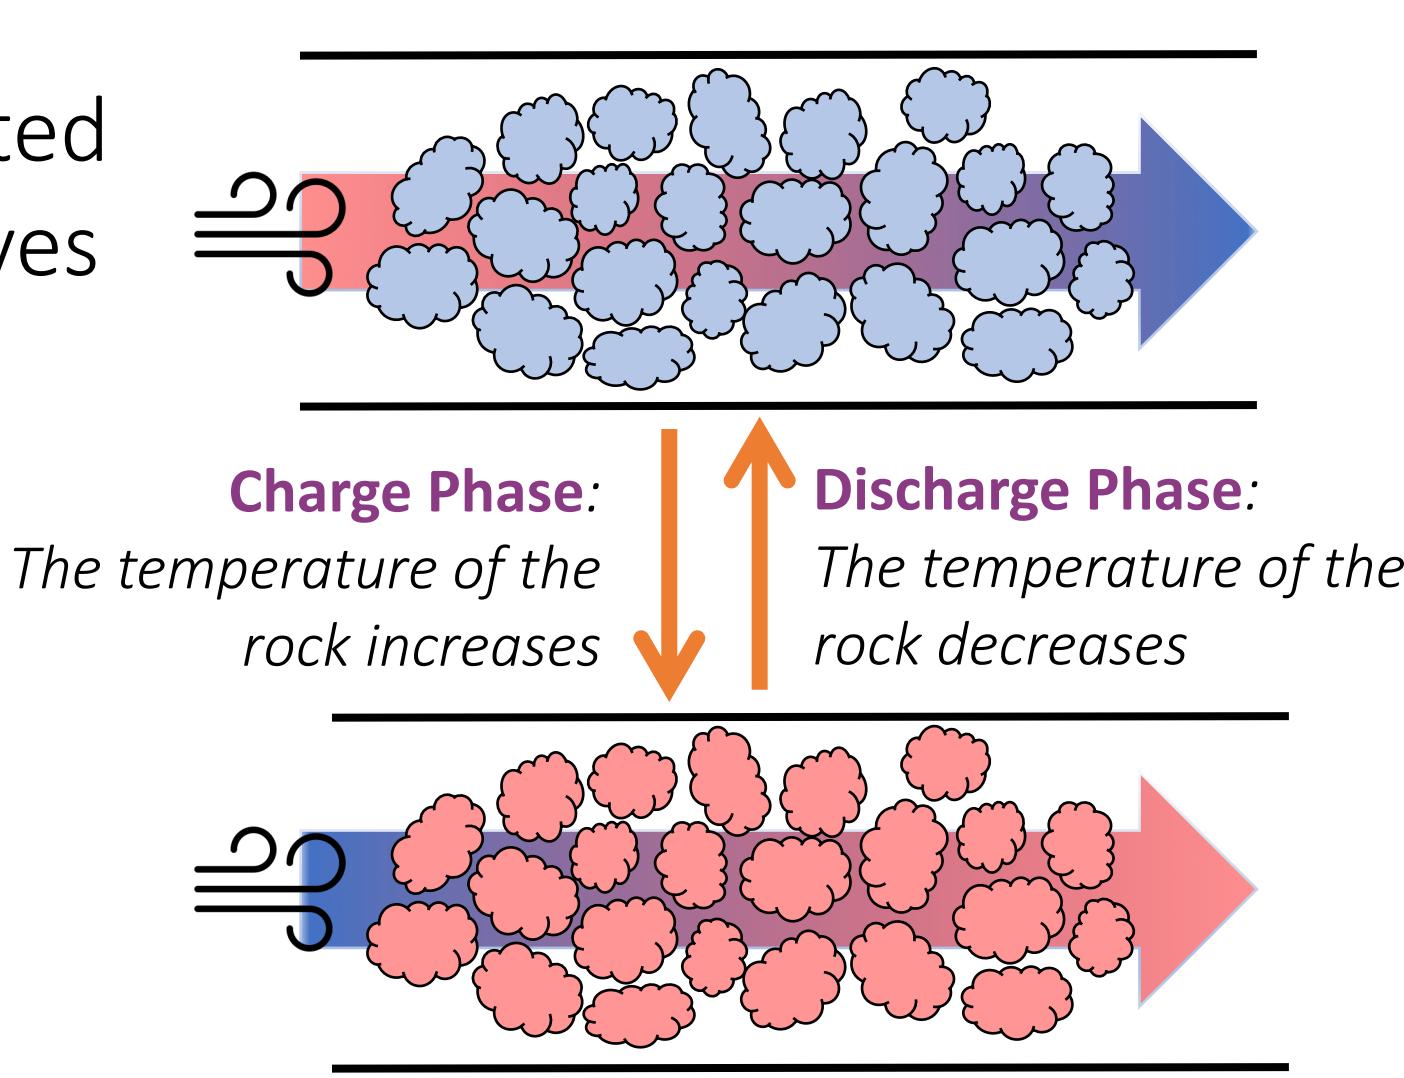

Store excess heat and release it when useful!

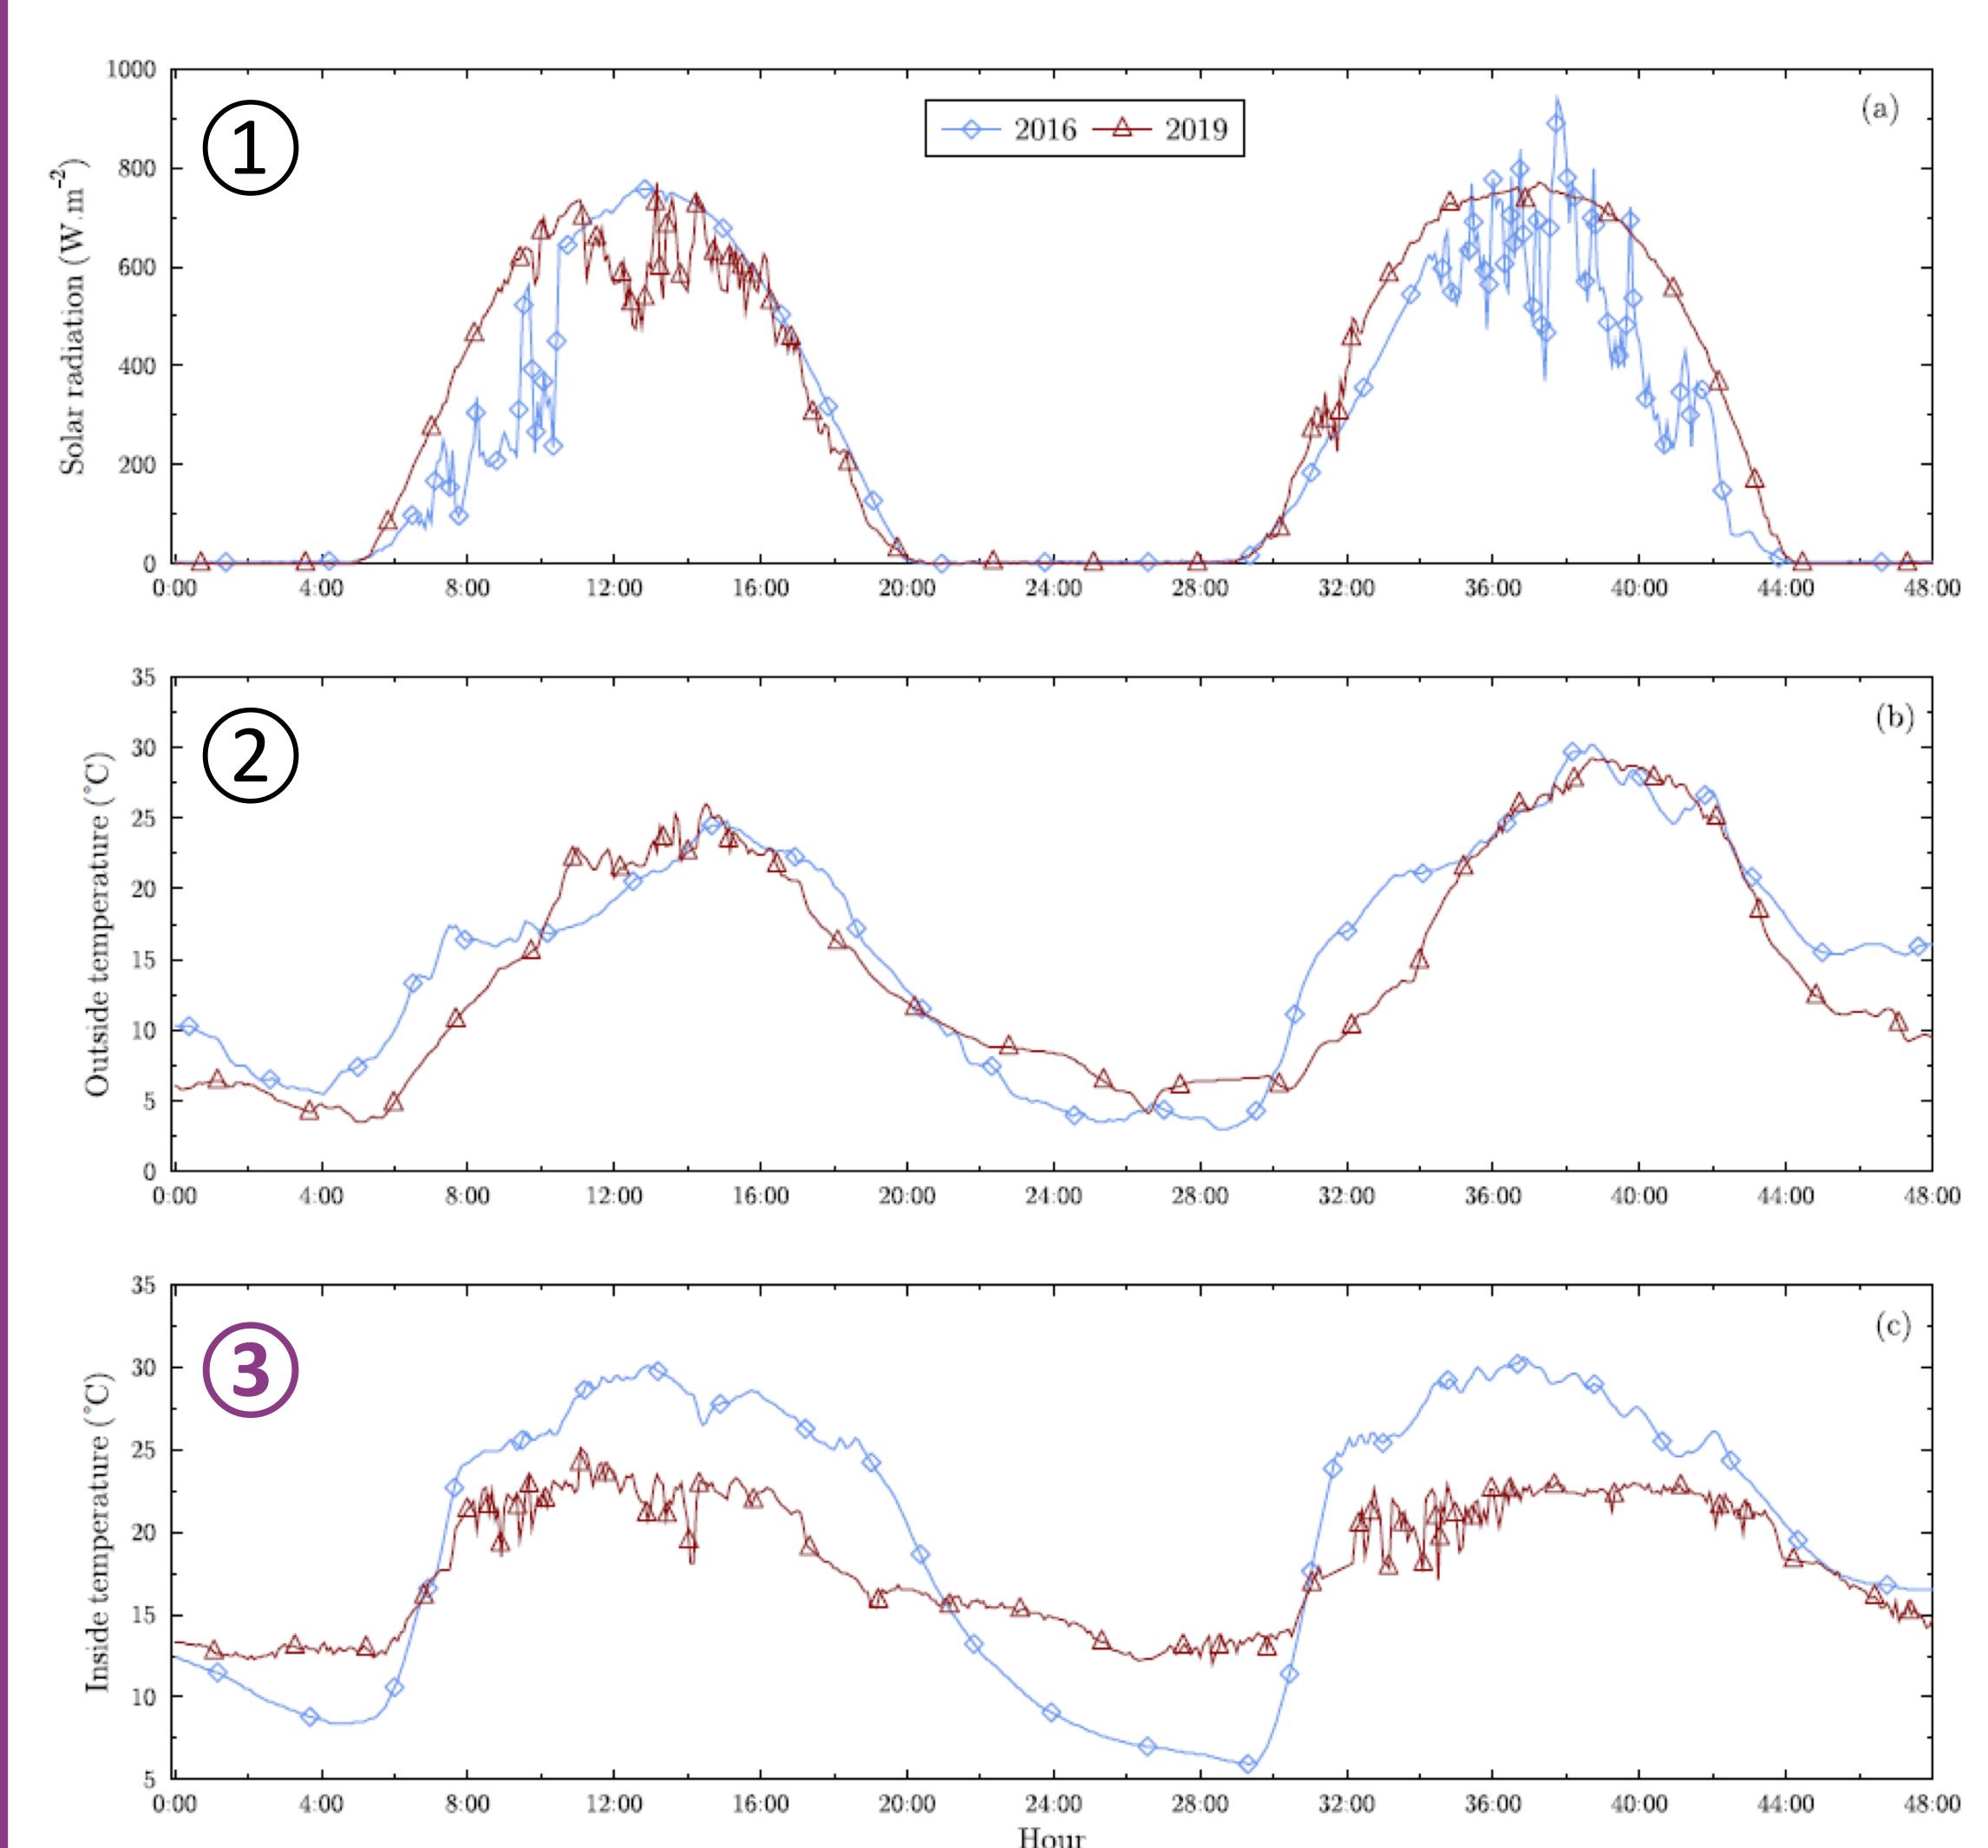

A solution...

During overheating, the hot air extracted passes through the storage system, gives up part of its heat → **Charge Phase**

During the night, the cold air passes through the stock to be heated → **Discharge phase**

Comparison of two periods with the same outside temperature ① and solar irradiation ②:

- Blue: without storage system
- Red: with storage system

➤ Inside temperature ③ variations are reduced, reducing the negative impact of extreme temperatures on growth!

Preliminary results

We would like to thank OHIM-Nunavik, the DRIIHM lab, the CFQCU and the Société du Plan Nord for their financial support, the KRG, the NV of Kuujjuaq and the Kuujjuaq Greenhouse Committee for their logistical support as well as all our scientific partners
